

Criminal Victimization, 2023

Susannah N. Tapp, PhD; Emilie J. Coen, DrPH, *BJS Statisticians*

In 2023, the rate of violent victimization in the United States was 22.5 victimizations per 1,000 persons age 12 or older, which was similar to the 2022 rate (figure 1). Violent victimization includes rape or sexual assault, robbery, aggravated assault, and simple assault. The last three decades saw an overall decline in the rate of violent victimization, from 1993 (79.8 per 1,000) to 2023. While the 2023 rate was

higher than those in 2020 and 2021, it was not statistically different from 5 years ago, in 2019.

Similarly, the rate of violent victimization reported to police was consistent from 2022 to 2023 (10.1 per 1,000 persons). The 2023 rate was higher than the 2020 (6.6 per 1,000) and 2021 (7.5 per 1,000) rates but was comparable to 5 years ago in 2019 and consistent with the overall downward trend since 1993 (33.8 per 1,000).

FIGURE 1
Rate of violent victimization and violent victimization reported to police, 1993–2023

Rate per 1,000 persons age 12 or older

Note: See table 1 for definitions and appendix table 1 for estimates, standard errors, and 95% confidence intervals. Estimates for 2006 should not be compared to other years. See *Criminal Victimization, 2007* (NCJ 224390, BJS, December 2008) for more information on changes to the 2006 National Crime Victimization Survey.

HIGHLIGHTS

- In 2023, there were 22.5 violent victimizations per 1,000 persons age 12 or older in the United States.
- The rate of violent victimization excluding simple assault for males decreased from 9.5 per 1,000 persons in 2022 to 6.9 per 1,000 in 2023.
- A smaller percentage of robbery victimizations that occurred in 2023 (42%) than in 2022 (64%) were reported to police.
- The percentage of motor vehicle thefts reported to police decreased from 81% in 2022 to 72% in 2023.
- About 9% of violent victimizations involved a firearm in 2023, similar to 2022.
- The percentage of persons age 12 or older who experienced at least one violent victimization declined from 1.51% in 2022 to 1.36% in 2023.
- A lower percentage of households were victims of burglary or trespassing in 2023 (1.01%) than in 2022 (1.12%).
- The rate of property victimization in urban areas increased from 176.1 per 1,000 households in 2022 to 192.3 per 1,000 in 2023.

Findings are based on the National Crime Victimization Survey (NCVS), a self-report survey administered annually from January 1 to December 31. Annual NCVS estimates are based on the number and characteristics of crimes that respondents experienced during the prior 6 months, excluding the month in which they were interviewed. Therefore, the 2023 survey covers crimes experienced from July 1, 2022 to November 30, 2023, with March 15, 2023, as the middle of the reference period. Crimes are classified by the year of the survey and not by the year of the crime. To make reliable comparisons over time, this report examines only NCVS data collected since the survey's 1993 redesign.

NCVS data can be used to produce:

- **Victimization estimates**—The total number of times that persons or households were victims of crime. For personal crimes, the number of victimizations is the number of victims of that crime. Each crime against a household is counted as having a single victim: the affected household.
- **Incident estimates**—The number of specific criminal acts involving one or more victims.
- **Prevalence estimates**—The number or percentage of unique persons who were crime victims, or of unique households that experienced crime.

See *Measurement of crime in the National Crime Victimization Survey* in the *Methodology* for more information. Use the interactive NCVS Dashboard (N-DASH) at <https://ncvs.bjs.ojp.gov> to view additional estimates and graphics.

Victimization estimates

Victimizations reflect the total number of times that persons or households were victims of crime. There were 6.4 million violent victimizations of persons age 12 or older in the United States in 2023 (**table 1**), which was not significantly different from the number in 2022 or 5 years ago in 2019.¹

Victimization rates measure the extent to which violent and property victimizations occur in a specified population during a specified time. In 2023, the rate of violent victimization was 22.5 victimizations per 1,000 persons age 12 or older, higher than in 2021 (16.5 per 1,000) but not significantly different from 2022. From 2022 to 2023, there were no significant changes in the rates of specific violent crime types.

Although there was no change in the rate of domestic violence (violent victimizations that were committed by current or former intimate partners or family members) from 2022 to 2023, the rate of intimate partner violence (violent victimizations that were committed by current or former spouses, boyfriends, or girlfriends) decreased from 3.4 victimizations per 1,000 persons age 12 or older in 2022 to 2.2 per 1,000 in 2023. There were no statistically significant changes in the rates of violent victimization by a stranger, with an injury, or with a weapon from 2022 to 2023.

¹In this report, statistical significance is reported at both the 90% and 95% confidence levels. All comparisons made in text are statistically significant unless otherwise stated. See figures and tables for testing on specific findings.

^fIncludes the subset of violent victimizations that were committed by current or former intimate partners or family members.

^gIncludes the subset of violent victimizations that were committed by current or former spouses, boyfriends, or girlfriends.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2019–2023.

The number of property victimizations in 2023 was similar to the number in 2022

Households in the United States experienced 13.6 million property victimizations in 2023 (table 2). The number of property victimizations was comparable to the number in 2022 but higher than the 12.8 million in 2019. Property crime includes burglary or trespassing, motor vehicle theft, and other types of household theft.

The rate of property victimization remained stable from 2022 to 2023 (102.2 victimizations per 1,000 households) and was similar to the rate in 2019. There were no significant differences in the rates of specific types of property victimizations between 2022 and 2023. Over the past 5 years, the motor vehicle theft rate increased from 3.9 per 1,000 households in 2019 to 6.1 per 1,000 in 2023, while the burglary or trespassing rate decreased from 17.2 per 1,000 to 13.1 per 1,000.

TABLE 2

‡Difference with comparison year is significant at the 90% confidence level.

^aRate is per 1,000 households. See appendix table 20 for household populations.

^bCalled household burglary in prior reports. Includes unlawful or forcible entry or attempted entry of places, including a permanent residence, other residence (e.g., a hotel room or vacation residence), or other structure (e.g., a garage or shed). Includes victimizations where the offender stole, attempted to steal, or did not attempt to steal. Excludes trespassing on land.

^cIncludes only crimes where the offender committed or attempted a theft.

^dIncludes crimes where the offender did not commit or attempt a theft. Excludes trespassing on land.

^eIncludes other unlawful taking or attempted unlawful taking of property or cash without personal contact with the victim.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2019–2023.

The rate of violent victimization excluding simple assault decreased for males in 2023

From 2022 to 2023, the violent victimization rate for persons in households earning \$200,000 or more decreased from 23.4 to 15.7 per 1,000 persons age 12 or older (**table 3**). Rates of violent victimization also decreased from 2022 to 2023 among persons ages 35 to 49 (25.8 per 1,000 to 21.2 per 1,000) and age 65 or older (10.5 per 1,000 to 7.8 per 1,000). The rate of violent victimization did not change significantly by sex, race or Hispanic origin, or marital status from 2022 to 2023.

The rate of violent victimization excluding simple assault decreased for males from 2022 (9.5 per 1,000) to 2023 (6.9 per 1,000), while the rate for females did not change significantly. The rate of violent victimization excluding simple assault also decreased for persons ages 12 to 17 and ages 35 to 49, married persons, divorced persons, and persons in households earning \$200,000 or more.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2022 and 2023.

Almost half of violent victimizations were reported to police in 2023

The NCVS collects information on whether crimes were reported or not reported to police and on the reasons why the crime was reported or not reported. Victims may not report a crime for a variety of reasons, including fear of reprisal or getting the offender in trouble, believing that police would not or could not do anything to help, and believing the crime to be a personal issue or too trivial to report. Reporting to police may occur during or immediately following a criminal incident or at a later date. Police may be notified by the victim or a third party (including witnesses; other victims; household members; or nonpolice officials, such as school officials or workplace managers), or police may have been at the scene of the incident.

Approximately 45% of violent victimizations were reported to police in 2023, which was not significantly different from 2022 (table 4). The percentage of rape or sexual assault victimizations reported to police increased significantly, from 21% in 2022 to 46% in 2023. A lower percentage of robbery victimizations were reported to police in 2023 (42%) than in 2022 (64%). During this period, the percentage of overall property crime victimizations reported to police decreased from 32% to 30%, due in part to a decline in the reporting of motor vehicle thefts to police (from 81% to 72%).

TABLE 4

A higher percentage of violent victimizations involving male victims were reported to police in 2023 than in 2022

From 2022 to 2023, the percentage of violent victimizations reported to police increased for male victims (38% to 46%) (table 5). The percentage of

violent victimizations reported to police also increased for victims who were never married (32% to 40%) and victims in households earning between \$100,000 and \$199,999 (38% to 50%).

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2022 and 2023.

The rate of violent victimization not reported to police in 2023 was not significantly different from 2022

In 2023, there were 1.1 robbery victimizations reported to police per 1,000 persons age 12 or older, down from 1.6 per 1,000 in 2022 (table 6). The rate of reported violent victimization committed by a stranger increased from 2022 to 2023 (3.8 to 5.1 per 1,000), while the rate of reported intimate partner violent victimization decreased (1.7 to 1.0 per 1,000).

The rate of unreported aggravated assault decreased from 2.7 victimizations per 1,000 persons in 2022 to 1.8 per 1,000 in 2023. In 2023, there were 1.6 motor vehicle theft victimizations that were not reported to police per 1,000 households, up from 0.9 per 1,000 in 2022.

‡Difference with comparison year is significant at the 90% confidence level.

^aExcludes homicide because the National Crime Victimization Survey (NCVS) is based on interviews with victims.

^bSee *Methodology* for details on the measurement of rape or sexual assault in the NCVS.

^cIncludes rape or sexual assault, robbery, and aggravated assault.

^dViolent crime categories such as domestic violence and violent crime with an injury are not mutually exclusive from other violent crime categories or other selected characteristics.

^eIncludes the subset of violent victimizations that were committed by current or former intimate partners or family members.

^fIncludes the subset of violent victimizations that were committed by current or former spouses, boyfriends, or girlfriends.

^gCalled household burglary in prior reports. Includes unlawful or forcible entry or attempted entry of places, including a permanent residence, other residence (e.g., a hotel room or vacation residence), or other structure (e.g., a garage or shed). Includes victimizations where the offender stole, attempted to steal, or did not attempt to steal. Excludes trespassing on land.

^hIncludes only crimes where the offender committed or attempted a theft.

ⁱIncludes crimes where the offender did not commit or attempt a theft. Excludes trespassing on land.

^jIncludes other unlawful taking or attempted unlawful taking of property or cash without personal contact with the victim.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2022 and 2023.

Veterans experienced more than 300,000 violent victimizations in 2023

Veterans experienced 328,520 violent victimizations (20.2 per 1,000 veterans) in 2023, which was not significantly different from the number and rate in 2022 (table 7).² The violent victimization rate for U.S. citizens in 2023 (23.1 per 1,000 U.S. citizens) also remained similar to the 2022 rate. However, the rate for non-U.S. citizens decreased from 19.9 per 1,000 non-U.S. citizens to 11.4 per 1,000.

The rate of property victimization in urban areas increased from 2022 to 2023

From 2022 to 2023, the rate of property victimization in urban areas increased from 176.1 victimizations per 1,000 households to 192.3 per 1,000 (table 8). In 2023, the rate of violent victimization in urban areas was 29.6 per 1,000 persons, which was not significantly different from the rate in 2022. Neither the rate of property nor of violent victimization in suburban and rural areas changed significantly from 2022 to 2023.

²Veterans are defined as persons currently or previously on active duty. Most NCVS respondents who are veterans were previously on active duty.

TABLE 7
Number and rate of violent victimizations, by veteran and citizenship status of victims, 2022 and 2023

Victim veteran and citizenship status	2022		2023*	
	Number	Rate per 1,000 ^a	Number	Rate per 1,000 ^a
Total violent victimizations^b	6,624,950	23.5	6,419,060	22.5

The percentage of violent victimizations for which victims received assistance from victim service providers did not change from 2022 to 2023

Victim service providers (VSPs) are public or private organizations that assist crime victims. Victims received VSP assistance in 8% of violent victimizations in 2023, similar to 2022 (table 9). From 2022 to 2023, the proportion of violent victimizations where VSP assistance was received did not change significantly for simple assault, violent crime excluding simple assault, or other selected characteristics of violent crime.

In 2023, 9% of violent victimizations involved a firearm

Of the more than 6.4 million violent victimizations in 2023, about 9% involved a firearm (table 10), which was not significantly different from the percentage in 2022. Firearm victimizations are violent victimizations where the offender possessed, showed, or used a firearm. About 75% of firearm victimizations were reported to police in 2023, up from 61% in 2022.

Incident estimates

An incident is a specific criminal act involving one or more victims.³ In 2023, there were 5.9 million violent incidents involving victims age 12 or older in the United States.

Males made up 49% of the population but were the perceived offenders in 75% of violent incidents in 2023

Patterns varied in the demographic characteristics of victims and offenders (as perceived by victims) involved in violent incidents. In 2023, the share of violent incidents involving male victims (45%) was lower than the share of males in the U.S. population (49%), while the proportion of violent incidents with female victims (55%) was higher than the proportion of females in the population (51%) (**table 11**). The percentage of violent incidents involving male offenders (75%) was 1.5 times the percentage of males in the population, and the

percentage of violent incidents with female offenders (20%) was less than half of the percentage of females in the population.

In 2023, Asian persons and Native Hawaiian or Other Pacific Islander persons were victims (3%) or offenders (1%) in a smaller proportion of violent incidents than their representation in the population (7%). The share of violent incidents involving white (54%) or Hispanic (14%) offenders was lower than the share of white (60%) or Hispanic (18%) persons in the population. The proportion of violent incidents with black offenders (24%) was higher than the proportion of black persons in the population (12%).

The percentages of violent incidents involving victims (33%) or offenders (23%) ages 18 to 29 were higher than this age group's share of the population (18%). The shares of incidents where the victims (58%) or offenders (62%) were age 30 or older was lower than this age group's proportion of the population (73%).

³Tables 11 through 13 present incident-level data on victims and offenders. Offender characteristics in the NCVS are based on victims' perceptions of offenders.

TABLE 11**Number and percent of violent incidents, by demographic characteristics of population, victims, and offenders, 2023**

†Difference with comparison group is significant at the 95% confidence level.

~Not applicable.

^aThe National Crime Victimization Survey (NCVS) population represents persons age 12 or older living in noninstitutionalized residential settings in the United States.

^bIncludes incidents in which the perceived offender characteristics were reported. The sex of the offender was unknown in 8% of incidents, the race or Hispanic origin of the offender was unknown in 17% of incidents, and the age of the offender was unknown in 17% of incidents.

^cExcludes persons of Hispanic origin (e.g., "white" refers to non-Hispanic white persons and "black" refers to non-Hispanic black persons).

^dIncludes single offenders identified as Hispanic and multiple-offender groups where all offenders were perceived to be Hispanic. In previous publications, if the victim perceived any of the offenders in a multiple-offender incident to be of Hispanic origin, they were classified as Hispanic.

^eIncludes victims who identified, or offenders who were perceived, as Asian only or Native Hawaiian or Other Pacific Islander only. Categories are not shown separately due to small numbers of sample cases.

^fIncludes victims who identified, or offenders who were perceived, as American Indian or Alaska Native only or as two or more races. Categories are not shown separately due to small numbers of sample cases.

^gIncludes multiple-offender groups of offenders perceived to be of two or more races or groups where one offender was perceived to be Hispanic and one offender was perceived to be one or more races.

^hWhile the NCVS does not survey victims age 11 or younger, victims may report the offender to be age 11 or younger.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2023.

In 2023, in about 4.1 million of the 5.9 million violent incidents in the United States, the offender was male, based on victims' perceptions of offenders' sex. More violent incidents with male victims involved male offenders (1,983,990 incidents) than female offenders (322,420) or both male and female offenders (145,440) (table 12). A higher number of violent incidents with female victims involved male offenders (2,118,160) than female offenders (776,020) or both male and female offenders (111,940).

Based on victims' perceptions of offenders' race or Hispanic origin, more violent incidents involving white victims were committed by white offenders (1,947,110 incidents) than by offenders of another or an unknown race or Hispanic origin (table 13). A greater number of incidents involving black victims were committed

by offenders who were black (486,910), and a lower number were committed by offenders who were Hispanic (40,880), than by offenders who were white (117,900). For incidents involving Hispanic victims, more incidents were committed by offenders who were white (377,750) than black (188,490) or those perceived to be of another race (64,660).⁴ There was no statistically significant difference in the number of incidents involving Hispanic victims that were committed by offenders who were white and those committed by Hispanic offenders.

⁴Prior to *Criminal Victimization, 2022* (NCJ 307089, BJS, September 2023), if the victim perceived any of the offenders in a multiple-offender incident to be of Hispanic origin, the offenders were classified as Hispanic. In this report, offenders were included in the "other" category when at least one offender was perceived as Hispanic and at least one was perceived as one or more races in a multiple-offender incident.

TABLE 12
Number of violent incidents, by sex of victims and offenders, 2023

Victim sex	Total violent incidents	Offender sex

‡Difference with comparison group is significant at the 90% confidence level.

! Interpret data with caution. Estimate is based on 10 or fewer sample cases, or coefficient of variation is greater than 50%.

^aSome victim categories are not shown due to small numbers of sample cases. Of the 5,934,570 violent incidents in 2023, a total of 487,420 involved victims who identified as Asian only, Native Hawaiian or Other Pacific Islander only, American Indian or Alaska Native only, or two or more races.

^bExcludes persons who identified or were perceived as being of Hispanic origin (e.g., "white" refers to non-Hispanic white persons and "black" refers to non-Hispanic black persons).

^cIncludes single offenders perceived to be of Hispanic origin and multiple-offender groups in which all offenders were perceived as Hispanic. In previous publications, if the victim perceived any of the offenders in a multiple-offender incident as Hispanic, the offenders were classified as Hispanic.

^dIncludes persons who identified or were perceived as Asian only, Native Hawaiian or Other Pacific Islander only, American Indian or Alaska Native only, or two or more races; and persons in multiple-offender incidents perceived as various races, including incidents in which one or more offenders were perceived as Hispanic and as two or more races. Categories are not shown separately due to small numbers of sample cases.

^eIncludes persons whose race or Hispanic origin was unknown to the victim.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2023.

Prevalence estimates

Prevalence reflects the number or percentage of unique persons or households that were victimized at least once during a given period. An estimated 1.36% of persons age 12 or older experienced one or more violent victimizations in 2023 (figure 2). This was a significant decrease from 2022 when 1.51% of persons

age 12 or older were victim of violent crime. In 2023, the prevalence of violent crime was significantly lower than 31 years before in 1993 (4.34%) but not significantly different than either 5 years ago in 2019 or 10 years ago in 2014. Violent crime excluding simple assault followed a similar trend to that of violent crime, with 0.54% of persons experiencing at least one victimization in 2023.

FIGURE 2
Percent of persons age 12 or older who were victims of violent crime and violent crime excluding simple assault, 1993–2023

Note: See table 1 for definitions and appendix table 15 for estimates, standard errors, and 95% confidence intervals. Estimates for 2006 should not be compared to other years. See *Criminal Victimization, 2007* (NCJ 224390, BJS, December 2008) for more information on changes to the 2006 National Crime Victimization Survey. Estimates may not match those previously published due to the development of a new weight for prevalence. For more information, see *A New Measure of Prevalence for the National Crime Victimization Survey* (NCJ 307554, BJS, April 2024).

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 1993–2023.

A new measure of prevalence

The Bureau of Justice Statistics transitioned to a new prevalence estimation procedure called the One Victimization Adjustment Method (OVAM).⁵ The old measure of prevalence had three main limitations:

- The relationship between victimizations and victims was distorted. If every person in the population experienced exactly one victimization, then the prevalence rate would equal the victimization rate. The old method did not account for this fact, so victims with only one victimization were overcounted.
- The old measure did not adjust for households and persons that were interviewed in only one half of the year. Households and persons with no victimizations in the 6-month interview period were assumed to have no victimizations in the year, which may not have been true.
- The old method did not adjust for “telescoping bias,” which occurs when a respondent mistakenly reports

crimes that they experienced before the 6-month interview period. For more information on addressing telescoping bias in the NCVS, see *National Crime Victimization Survey, 2016: Technical Documentation* (NCJ 251442, BJS, December 2017).

The OVAM aims to overcome the old procedure’s limitations by making victimization and prevalence rates the same for persons who experienced exactly one victimization. The OVAM also implicitly accounts for the fact that an individual may be interviewed in only one half of the year and adjusts for telescoping bias through the use of the victimization weight. See *Methodology* for more information.

The new procedure has implications for the interpretation of prevalence estimates. As a result of the transition to this new method, prevalence estimates in this report are not directly comparable to prevalence estimates in prior *Criminal Victimization* reports. Trends for specific types of crime or specific years of interest should be re-calculated using the OVAM. The report *A New Measure of Prevalence for the National Crime Victimization Survey* (NCJ 307554, BJS, April 2024) shows estimates of the prevalence of violent and property crime from 1993 to 2022 using the old and new method.

⁵Details on the development of the new procedure can be found in *National Crime Victimization Survey: Prevalence Estimation Methods* (NCJ 308745, BJS, April 2024). For a comparison of the old and new prevalence estimation methods, see *A New Measure of Prevalence for the National Crime Victimization Survey* (NCJ 307554, BJS, April 2024).

A lower percentage of persons were victims of violent crime in 2023 than in 2022

In addition to the prevalence of overall violent crime, the percentage of persons experiencing rape or sexual assault was lower in 2023 (0.10%) than in 2022 (0.14%)

(table 14). There were also decreases from 2022 to 2023 in aggravated assault, violent crime excluding simple assault, domestic violence, intimate partner violence, and violent crime involving a weapon. The prevalence of intimate partner violence decreased from 2019 (0.13%) to 2023 (0.10%).

^dSee *Methodology* for details on the measurement of rape or sexual assault in the NCVS.

^eIncludes rape or sexual assault, robbery, and aggravated assault.

^fViolent crime categories such as domestic violence and violent crime with an injury are not mutually exclusive from other violent crime categories or other selected characteristics.

^gIncludes the subset of violent victimizations that were committed by current or former intimate partners or family members.

^hIncludes the subset of violent victimizations that were committed by current or former spouses, boyfriends, or girlfriends.

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2019–2023.

Between 2022 and 2023, the percentage of females who experienced one or more violent crimes decreased from 1.49% to 1.33% (table 15). A lower percentage of white persons experienced one or more violent victimizations in 2023 (1.32%) than in 2022 (1.48%). The prevalence of violent crime decreased from 2022 to 2023 for persons

ages 12 to 17 (from 2.03% to 1.45%) and persons ages 25 to 34 (2.18% to 1.71%). From 2022 to 2023, declines were also observed in the percentages of persons who were never married, separated persons, and persons in households earning \$25,000 or less who experienced at least one violent crime.

TABLE 15

Number and percent of persons who were victims of violent crime, by demographic characteristics of victims, 2022 and 2023

Source: Bureau of Justice Statistics, National Crime Victimization Survey, 2022 and 2023.

The prevalence of burglary or trespassing was lower in 2023 than 5 years prior in 2019

In 2023, about 10.2 million households in the country experienced one or more property victimizations (burglary or trespassing, motor vehicle theft, or other household theft), similar to the number of households

in 2022 (table 16). The prevalence of burglary or trespassing declined from 1.38% 5 years ago in 2019 to 1.01% in 2023. The percentage of households that experienced motor vehicle theft increased from 2019 (0.37%) to 2023 (0.56%), but did not change significantly from 2022 to 2023.

Methodology

Survey coverage

The Bureau of Justice Statistics' (BJS) National Crime Victimization Survey (NCVS) is an annual data collection carried out by the U.S. Census Bureau. The NCVS is a self-report survey that is administered annually from January 1 to December 31. Annual NCVS estimates are based on the number and characteristics of crimes that respondents experienced during the prior 6 months, excluding the month in which they were interviewed. Therefore, the 2023 survey covers crimes experienced from July 1, 2022 to November 30, 2023, with March 15, 2023, as the middle of the reference period. Crimes are classified by the year of the survey and not by the year of the crime.

The NCVS is administered to persons age 12 or older from a nationally representative sample of U.S. households. It collects information on nonfatal personal crimes (rape or sexual assault, robbery, aggravated assault, simple assault, and personal larceny (purse snatching and pocket picking)) and household property crimes (burglary or trespassing, motor vehicle theft, and other types of theft).

The survey collects information on threatened, attempted, and completed crimes. It collects data on both crimes reported and not reported to police. Unless specified otherwise, estimates in this report include threatened, attempted, and completed crimes. In addition to providing annual-level and change estimates on criminal victimization, the NCVS is the primary source of information on the nature of criminal victimization incidents.

Survey respondents provide information about themselves (e.g., age, sex, race, Hispanic origin, marital status, education level, and income) and whether they experienced a victimization. For each victimization incident, respondents report information about the offender (e.g., victim-offender relationship and perceived age, sex, race, and Hispanic origin of offender(s)), characteristics of the crime (e.g., time and place of occurrence, use of weapons, nature of injury, and economic consequences), whether the crime was reported to police, reasons the crime was or was not reported, and experiences with the criminal justice system.

Household information, including household-level demographics (e.g., income) and property victimizations committed against the household (e.g., burglary or

trespassing), is typically collected from the reference person. The reference person is any responsible adult (age 18 or older) member of the household who is unlikely to permanently leave the household. Because an owner or renter of the sampled housing unit is normally the most responsible and knowledgeable household member, this person is generally designated as the reference person and household respondent. However, a household respondent does not have to be one of the household members who owns or rents the unit.

In the NCVS, a household is defined as a group of persons who all reside at a sampled address. Persons are considered household members when the sampled address is their usual place of residence at the time of the interview and when they do not have another primary place of residence. Once selected, households remain in the sample for 3.5 years, and all eligible persons in these households are interviewed every 6 months, for a total of seven interviews.

First interviews are typically conducted in person, with subsequent interviews conducted either in person or by phone. New households rotate into the sample on an ongoing basis to replace outgoing households that have been in the sample for the full 3.5-year period. The sample includes persons living in group quarters, such as dormitories, rooming houses, and religious group dwellings, and excludes persons living on military bases or in institutional settings, such as correctional or hospital facilities.

Measurement of crime in the National Crime Victimization Survey

NCVS data can be used to produce several types of estimates, including victimization, incident, and prevalence rates. Victimization rates measure the extent to which violent and property victimizations occur in a specified population during a specified time. Victimization numbers show the total number of times that persons or households are victimized by crime. For crimes affecting persons, NCVS victimization rates are estimated by dividing the number of victimizations that occur during a specified time (T) by the population at risk for those victimizations and then multiplying the rate by 1,000.

$$\text{Victimization rate}_T = \frac{\text{Number of victimizations experienced by a specified population}_T}{\text{Number of unique persons (or households) in the specified population}_T} \times 1,000$$

For *victimization rates*, each victimization represents one person (for personal crimes) or one household

(for property crimes) affected by a crime.⁶ Every victimization experienced by a person or household during the year is counted. For example, if one person experiences two violent crimes during the year, both are counted in the victimization rate. If one household experiences two property crimes, both are counted in the victimization rate. Victimization estimates are presented in figure 1 and tables 1 through 10 in this report.

Incident rates are another measure of crime. The number of incidents is the number of specific criminal acts involving one or more victims. If every victimization had one victim, the number of incidents would be the same as the number of victimizations. If there was more than one victim, the incident estimate is adjusted to compensate for the possibility that the incident could be reported several times by multiple victims and thus be overcounted. For example, if two people were robbed during the same incident, this crime would be counted as one incident and two victimizations. Incident estimates are presented in tables 11 through 13 in this report.

Prevalence rates are a third measure that reflects a population’s risk of experiencing one or more criminal victimizations. They describe the level of victimization, like victimization rates, but are based on the number of unique persons or households in the population experiencing at least one victimization during a specified time. Prevalence estimates are presented in figure 2 and tables 14 through 16 in this report.

The key distinction between a victimization rate and a prevalence rate is whether the numerator consists of the number of victimizations or the number of unique victims. For example, a person who experienced two robberies within the past year would be counted twice in the victimization rate but only once in the prevalence rate. Prevalence rates are estimated by dividing the number of unique victims or victimized households in the specified population by the total number of persons or households in the population and multiplying the rate by 100, yielding the percentage of the population victimized at least once in a period.

$$\text{Prevalence rate}_{\tau} = \frac{\text{Number of unique victims (or victimized households) in a specified population}_{\tau}}{\text{Number of unique persons (or households) in the specified population}_{\tau}} \times 100$$

⁶In the NCVS, personal crimes are personal larceny (purse snatching and pocket picking) and violent victimizations (rape or sexual assault, robbery, aggravated assault, and simple assault). Homicide is not included because the NCVS is based on interviews with victims. Property crimes are burglary or trespassing, motor vehicle theft, and other theft.

Prior to this report, estimates of prevalence were calculated using the person and household weights. Beginning with this report, estimates of prevalence were calculated using the One Victimization Adjustment Method. For more information about measuring prevalence in the NCVS, see *A new measure of prevalence in this report, National Crime Victimization Survey: Prevalence Estimation Methods* (NCJ 308745, BJS, April 2024), and *A New Measure of Prevalence for the National Crime Victimization Survey* (NCJ 307554, BJS, April 2024).

Nonresponse and weighting adjustments

The 2023 NCVS data file includes 142,028 household interviews. Overall, 63% of eligible households completed interviews. Within participating households, interviews with 226,480 persons were completed in 2023, representing an 82% unweighted response rate among eligible persons from responding households.

Victimizations that occurred outside of the United States were excluded from this report. In 2023, about 0.6% of the unweighted victimizations occurred outside of the United States.

NCVS data are weighted to produce annual estimates of victimization for persons age 12 or older living in U.S. households. Because the NCVS relies on a sample rather than a census of the entire U.S. population, weights are designed to adjust to known population totals and to compensate for survey nonresponse and other aspects of the complex sample design.

NCVS data files include person, household, victimization, and incident weights. Person weights provide an estimate of the population represented by each person in the sample. Household weights provide an estimate of the household population represented by each household in the sample. After proper adjustment, both person and household weights are also typically used to form the denominator in calculations of crime rates.

For personal crimes, the incident weight is derived by dividing the person weight of a victim by the total number of persons victimized during an incident, as reported by the respondent. For property crimes measured at the household level, the incident weight and the household weight are the same because the victim of a property crime is considered to be the household as a whole. The incident weight is most frequently used when examining offender demographics.

Victimization weights used in this report account for the number of persons victimized during an incident and for high-frequency repeat victimizations (i.e., series victimizations). Series victimizations are similar in type to one another but occur with such frequency that a victim is unable to recall each individual event or describe each event in detail. Survey procedures allow NCVS interviewers to identify and classify these similar victimizations as series victimizations and to collect detailed information on only the most recent incident in the series.

The weighting counts series victimizations as the actual number of victimizations reported by the victim, up to a maximum of 10. Doing so produces more reliable estimates of crime levels than counting such victimizations only once, while the cap at 10 minimizes the effect of extreme outliers on rates.

According to the 2023 data, series victimizations accounted for 1.5% of all victimizations and 3.8% of all violent victimizations. Additional information on the enumeration and survey procedures of series victimizations is detailed in *Methods for Counting High-Frequency Repeat Victimizations in the National Crime Victimization Survey* (NCJ 237308, BJS, April 2012).

Revised 2016 data file

For 2016, BJS increased the NCVS sample size to facilitate the ability to produce state-level victimization estimates for the 22 most populous states. At the same time, the sample was adjusted to reflect the U.S. population counts in the 2010 decennial census. These changes resulted in a historically large number of new households and first-time interviews in the first half of 2016 and produced challenges in comparing 2016 results to data from prior years.

Working with the U.S. Census Bureau, BJS subsequently devised the methodology that was used to create the revised 2016 NCVS data file. The result was revised criminal victimization estimates that were nationally representative for 2016 and could be compared with prior and future years. For more information, see the *National Crime Victimization Survey revised 2016 estimates* text box (pp. 3–4) and *Methodology* (pp. 15–18) in *Criminal Victimization, 2016: Revised* (NCJ 252121, BJS, October 2018).

Changes to the household weighting adjustment in 2017

The 2017 NCVS weights included a new adjustment so household weights reflected independent housing unit totals available internally at the U.S. Census Bureau. This new adjustment was applied only to household weights and did not affect person weights. Historically, the household weights were adjusted to reflect independent totals for the person population. This new weighting adjustment improves on the prior one and better aligns the number of estimated households in the NCVS with other U.S. Census Bureau household survey estimates.

Due to this new adjustment, the 2017 NCVS estimate for the number of households was about 8% lower than the 2016 NCVS estimate. As a result, the estimate of the number of households affected by property crime was also about 8% lower. When making comparisons of property crime at the household level between 2017 and other years, it is necessary to compare victimization or prevalence rates. Rates are unaffected by this change in weighting methodology because both the numerator and denominator are equally affected.

Comparisons of the number of households that were victimized in 2017 and in prior years are inappropriate due to this change in weighting methodology. For more information on weighting in the NCVS, see *Nonresponse and weighting adjustments* in this report and *National Crime Victimization Survey, 2016: Technical Documentation* (NCJ 251442, BJS, December 2017).

Weighting adjustments in 2020

The 2020 NCVS weights included an additional adjustment to address the impact of modified field operations due to COVID-19. For more information on the weighting adjustments applied in 2020, see the *Source and Accuracy Statement for the 2020 National Crime Victimization Survey* in the NCVS 2020 Codebook (<https://www.icpsr.umich.edu/web/NACJD/studies/38090/datadocumentation>) and *National Crime Victimization Survey, 2016: Technical Documentation* (NCJ 251442, BJS, December 2017).

Beginning in 2020, BJS incorporated another factor to moderate the contribution of outlier weights on NCVS estimates. For more information on this methodology, see the *Source and Accuracy Statement for the 2020 National Crime Victimization Survey* in the NCVS 2020 Codebook (<https://www.icpsr.umich.edu/web/NACJD/studies/38090/datadocumentation>) and *National Crime Victimization Survey: Assessment of Outlier Weights* (NCJ 302186, BJS, October 2021).

Standard error computations

When national estimates are derived from a sample, as with the NCVS, caution must be used when comparing one estimate to another or when comparing estimates over time. Although one estimate may be larger than another, estimates based on a sample have some degree of sampling error. The sampling error of an estimate depends on several factors, including the amount of variation in the responses and the size of the sample. When the sampling error around an estimate is taken into account, estimates that appear different may not be statistically significant.

One measure of the sampling error associated with an estimate is the standard error. The standard error may vary from one estimate to the next. Generally, an estimate with a smaller standard error provides a more reliable approximation of the true value than an estimate with a larger standard error. Estimates with relatively large standard errors have less precision and reliability and should be interpreted with caution.

For complex sample designs, there are several methods that can be used to generate standard errors around a point estimate (e.g., numbers, percentages, and rates). These include direct variance estimation and generalized variance function (GVF) parameters.

BJS uses a specialized version of Balanced Repeated Replication (BRR) estimation using Fay's method to generate standard errors around the victimization estimates.⁷ BRR estimation is a type of direct replication variance estimation. Under replicate variance estimation, a set of replicate weights (e.g., the NCVS typically has a set consisting of 160 replicate weights) is used to capture the sampling variance. Fay's method is used for surveys that have rare outcomes in which the entire sample is necessary to properly estimate the variance. The standard errors for victimization and incident estimates in this report were estimated using BRR and differ from those reported in prior *Criminal Victimization* reports, which used GVF parameters. (See appendix tables 2 through 14). Year-to-year statistically significant differences may also vary from previous reports.

For prevalence estimates, BJS uses BRR and Taylor Series Linearization (TSL) methods to generate standard errors around these estimates. The TSL method directly estimates variances through a linearized function by combining variance estimates from the stratum and primary sampling units (PSUs) used to sample

households and persons.⁸ In the NCVS, the design parameters used for computing TSL variances are PSEUDOSTRATA (stratum) and HALFSAMPLE (PSU). These design parameters are available for all years except the first half of 1993 and all of 2016; therefore, BRR methods were used for 2016 prevalence estimates. The standard errors for prevalence estimates in this report were estimated using TSL (see figure 2 and appendix tables 15 through 18).

Another method used to produce standard errors for NCVS estimates is through GVF parameters. The U.S. Census Bureau produces GVF parameters for BJS, which account for aspects of the NCVS's complex sample design and represent the curve fitted to a selection of individual standard errors, using a specialized version of BRR based on Fay's method. The standard errors for figure 1 were estimated using GVFs.

GVFs express the variance as a function of the expected value of the survey estimate.⁹ The GVF parameters are generated by fitting estimates and their relative variance to a regression model, using an iterative weighted least-squares procedure where the weight is the inverse of the square of the predicted relative variance. For more information on GVFs, see the most recent version of the *National Crime Victimization Survey, 2016: Technical Documentation* (NCJ 251442, BJS, December 2017). GVF parameters are available in the data documentation published with the NCVS public use files through the National Archive of Criminal Justice Data (<https://www.icpsr.umich.edu/web/NACJD/series/95>).

Direct variance estimation (e.g., BRR and TSL) is generally considered more accurate than GVFs in terms of how closely the variance estimate approximates the true variance. With direct variance estimation, each estimate is generated based on the outcome being estimated rather than being generated based on a generalized function.

BJS conducted statistical tests to determine whether differences in estimated numbers, percentages, and rates in this report were statistically significant once sampling error was taken into account. Using statistical analysis programs developed specifically for the NCVS, all comparisons in the text of this report were tested for significance. The primary test procedure was the Student's t-statistic, which tests the difference between two sample estimates. Findings described in this report as increases or decreases passed a test at either the

⁹Ibid.

0.05 level (95% confidence level) or 0.10 level (90% confidence level) of significance. Figures and tables in this report should be referenced for testing on specific findings.

Estimates and standard errors of the estimates in this report may be used to generate a confidence interval around the estimate as a measure of the margin of error. The following example illustrates how standard errors may be used to generate confidence intervals:

Based on the 2023 NCVS, the rate of violent victimization in 2023 was 22.5 victimizations per 1,000 persons age 12 or older. (See table 1.) Using the BRR method of direct variance estimation, BJS determined that the estimated victimization rate has a standard error of 1.03. (See appendix table 2.) A confidence interval around the estimate is generated by multiplying the standard error by ± 1.96 (the t-score of a normal, two-tailed distribution that excludes 2.5% at either end of the distribution). Therefore, the 95% confidence interval around the 22.5 estimate from 2023 is $22.5 \pm (1.03 \times 1.96)$ or (20.51 to 24.56). In other words, if BJS used the same sampling method to select different samples and computed an interval estimate for each sample, it would expect the true population parameter (rate of violent victimization) to fall within the interval estimates 95% of the time.

Confidence intervals for flagged estimates should be interpreted with caution, as large standard errors may result in a lower bound estimate of less than zero. For this report, BJS also calculated a coefficient of variation (CV) for all estimates, representing the ratio of the standard error to the estimate. CVs (not shown in tables) provide another measure of reliability and a means for comparing the precision of estimates across measures with differing levels or metrics.

NCVS measurement of rape or sexual assault

The NCVS uses a two-stage measurement approach in the screening and classification of criminal victimization, including rape or sexual assault. In the first stage of screening, survey respondents are administered a series of short-cue screening questions designed to help them think about different experiences they may have had during the reference period. (See NCVS-1/basic screen questionnaire at <https://bjs.ojp.gov/data-collection/ncvs#surveys-0>.)

This design improves respondents' recall of events, particularly for incidents that may not immediately come to mind as crimes, such as those committed by family members and acquaintances. Respondents who answer affirmatively to any of the short-cue screening items are subsequently administered a crime incident report (CIR) designed to classify incidents into specific crime types. (See NCVS-2/CIR at <https://bjs.ojp.gov/data-collection/ncvs#surveys-0>.)

First stage of measurement. Two short-cue screening questions are specifically designed to target sexual victimization:

1. Other than any incidents already mentioned, has anyone attacked or threatened you in any of these ways—
 - a. with any weapon, such as a gun or knife
 - b. with anything like a baseball bat, frying pan, scissors, or stick
 - c. by something thrown, such as a rock or bottle
 - d. by grabbing, punching, or choking
 - e. any rape, attempted rape, or other type of sexual attack
 - f. any face-to-face threats
 - g. any attack or threat or use of force by anyone at all? Please mention it even if you are not certain it was a crime.
2. Incidents involving forced or unwanted sexual acts are often difficult to talk about. Other than any incidents already mentioned, have you been forced or coerced to engage in unwanted sexual activity by—
 - a. someone you did not know
 - b. a casual acquaintance
 - c. someone you know well?

With regard to sexual victimization, respondents may screen into a CIR if they respond affirmatively to other short-cue screening questions. For instance, a separate screening question cues respondents to think of attacks or threats that took place in specific locations, such as at home, work, or school. Respondents who recall a sexual victimization that occurred at home, work, or school and answer affirmatively would be administered a CIR even if they did not respond affirmatively to the screening question targeting sexual victimization.

Second stage of measurement. The CIR is used to collect information on the attributes of each incident. The key attributes of sexual violence that are used to classify a victimization as a rape or sexual assault are the type of attack and physical injury suffered. Victims are asked if “the offender hit you, knock[ed] you down, or actually attack[ed] you in any way”; if “the offender TR[IED] to attack you”; or if “the offender THREATEN[ED] you with harm in any way?” The survey participant is classified as a victim of rape or sexual assault if they respond affirmatively to one of these three questions and then respond that the completed, attempted, or threatened attack was:

- rape
- attempted rape
- sexual assault other than rape or attempted rape
- verbal threat of rape
- verbal threat of sexual assault other than rape
- unwanted sexual contact with force (grabbing, fondling, etc.)
- unwanted sexual contact without force (grabbing, fondling, etc.).

If the victim selects one of the following response options to describe the attack, they are also classified as a victim of rape or sexual assault if the injuries suffered as a result of the incident are described as:

- rape
- attempted rape
- sexual assault other than rape or attempted rape.

Coercion. The CIR does not ask respondents if psychological coercion was used, nor make any explicit reference to the victim being unable to provide consent (e.g., in incidents involving drug or alcohol use). One screening question targeted to rape and sexual assault asks respondents if force or coercion was used to initiate unwanted sexual activity.

The final classification of incidents by the CIR results in the following definitions of rape and sexual assault used in the NCVS:

Rape. Coerced or forced sexual intercourse. Forced sexual intercourse means vaginal, anal, or oral penetration by the offender(s). This category could include incidents where the penetration was from a foreign object such as a bottle. It includes attempted rape, threatened rape, male and female victims, and incidents involving victims and offenders who are the same sex or different sexes.

Sexual assault. A wide range of victimizations separate from rape, attempted rape, or threatened rape. These crimes include attacks or threatened attacks involving unwanted sexual contact between the victim and offender. Sexual assaults may or may not involve force and include such things as grabbing or fondling.

The table *Classification of rape and sexual assault in the National Crime Victimization Survey* outlines how different types of sexual violence are categorized in the NCVS. For more information on how these crimes are classified, see the section *Measuring Rape and Sexual Assault* in the NCVS data documentation published with the NCVS public use files through the National Archive of Criminal Justice Data (<https://www.icpsr.umich.edu/web/ICPSR/series/95>).

Classification of rape and sexual assault in the National Crime Victimization Survey	
Measure	Element of sexual violence
Completed rape	Type of attack = rape Type of injury = rape
Attempted rape	Type of attack = attempted rape Type of injury = attempted rape Type of threat = verbal threat of rape with weapon
Threatened rape	Type of attempted attack/threat = verbal threat of rape
Sexual assault	Type of attack = sexual assault other than rape or attempted rape Type of injury = sexual assault other than rape or attempted rape Type of attempted attack/threat = unwanted sexual contact with force Type of attempted attack/threat = unwanted sexual contact without force Type of attempted attack/threat = verbal threat of sexual assault other than rape

Note: Victim is determined to be present in all measures of rape and sexual assault.

^aExcludes persons of Hispanic origin (e.g., “white” refers to non-Hispanic white persons and “black” refers to non-Hispanic black persons).

^bIncludes persons who identified as Asian only or Native Hawaiian or Other Pacific Islander only. Categories are not shown separately due to small numbers of sample cases.

^cIncludes persons who identified as American Indian or Alaska Native only or as two or more races. Categories are not shown separately due to small numbers of sample cases.

^dEstimates do not sum to totals because of missing data on marital status.

The Bureau of Justice Statistics of the U.S. Department of Justice is the principal federal agency responsible for measuring crime, criminal victimization, criminal offenders, victims of crime, correlates of crime, and the operation of criminal and civil justice systems at the federal, state, tribal, and local levels. BJS collects, analyzes, and disseminates reliable statistics on crime and justice systems in the United States, supports improvements to state and local criminal justice information systems, and participates with national and international organizations to develop and recommend national standards for justice statistics. Kevin M. Scott, PhD, is the acting director.

This report was written by Susannah N. Tapp, PhD, and Emilie J. Coen, DrPH. Emily Berg, PhD, BJS Visiting Fellow, contributed to the report. Alexandra Thompson, Erika Harrell, PhD, and Stephanie Mueller verified the report.

Kathryn A. Sweeney, PhD, edited the report. Jeffrey Link produced the report.
